

	<b>Bruder Moist Heat Eye Compress with MediBeads®</b>	<b>Others</b>
<b>Technology</b>	Only the Bruder compress contains <b>patented MediBeads®</b> which absorb water molecules into the center of the bead for an even, consistent heat delivery.	Other compresses contain silica gel beads, gel or grains. These compresses attract water molecules to the surface, not the core of the bead, resulting in uneven, inconsistent heat.
<b>Heat</b>	MediBeads® provide uniform <b>moist heat</b> , the most penetrating type of heat.	Other materials can dry out and release uneven heat, which can cause hot spots that are dangerous and reduce product performance.
<b>Hygiene</b>	MediBeads® are silver-infused. Incorporating silver into the bead structure ensures pure, clean, moist heat with every use, helping to <b>repel bacteria</b> and keep eyelids clean.	Other compresses can harbor bacteria that can increase the risk of infection.
<b>Design</b>	An ergonomic, <b>patent-pending two-pod adjustable design</b> comfortably fits all facial types, with no cumbersome cover to hinder heat penetration and effectiveness.	One-size-fits-all compresses with cumbersome covers can impact fit and interfere with effective therapy.
<b>Durability</b>	<b>MediBeads® don't break down</b> with repeated use and washing. The entire compress can be washed with no impact on efficacy.	Silica gel beads, gel and grains break down with handling and washing.
<b>Testing</b>	Clinical tests show the Bruder Compress is effective by virtue of its design, its transfer of penetrating moist heat, and its <b>ability to increase patient compliance</b> .	Other compresses cannot support efficacy with the same degree of rigorous clinical test results.
